

An English Translation of Relevant Portions of Utility Model Application No. S55-74090,  
laid-open on May 21, 1980

Claim

A connecting structure for a compact electronic device that includes a first and a second circuit portions, and a first and a second casings that house the circuit portions respectively, wherein the first and the second circuit portions are electrically connected together, the connecting structure comprising:

at least a pair of bearings that fits together and are arranged at end portions of the first and the second casings, respectively;

a pin that penetrates the bearings and rotatably connects the first and the second casings together;

a flexible printing board that electrically connects the first and the second circuit portions together and is wound around the pin; and

a cover that covers a portion of the printing board wound around the pin.
